## Hinge mortising template home depot

When I built the shelving unit for the inside of my laundry room utility closet door, I built it with the intentions of loading it up full of stuff. Only problem with that is I now had a rockin tough unit ready to be loaded but my door was stocked with little puny hinges that couldn't bear the load. My solution was to add another hinge in the middle of the door and also upgrade the hinges. The door had two existing regular interior hinges, for replacements I bought commercial grade hinges. You see these often on metal doors, like at commercial car shops and what not. 1) I took the door off and moved it out to the shop. See puny hinge below. 2) I didn't put much thought into where I was going to put the third mortise (the sunken cavity where the hinge goes in the door jam and door is called the mortise), I picked a place that looked about in the middle and went with it. Then I bought a template for mortising doors at Home Depot. The template does exactly what it sounds like: you put in the size of your hinge, clamp it to the door, and then all you have to do is take your hand router and carve away. Once you take the template off, you have yourself a perfect mortise where you slip the hinge in place and screw it in. Quick note: Since my original hinges were rounded edges, I thought to stick with rounded hinges. However, the tough hinges only come in square cut and in ugly grey. 3) The template always produces a rounded edge mortise but since my hinges were square, after I took the template off I got a chisel and hammer (you can also use a flat nose screwdriver) and just chipped out the corners. Also, since I was converting from rounded to square on the existing ones I chipped those corners as well. 4) Next I went inside and did the same chipping corners routine with the mortises on the door jam. Now it was time to make the third mortise from scrap. The template I purchased at Home Depot which is made by Ryobi, only clamps onto the door..... it does not clamp onto the door jam. 5) Since the template doesn't clamp onto the door jam I brought out my wood chisels and bought me something called a butt marker. ...yep, a butt marker. It is a nifty little tool that cost about \$5 at Home Depot that you place where you want your desired mortise and hit it with a hammer until it leaves an impression. Then once you remove it, you can take your chisels and chisel out within the lines. Very handy. So that's what I did. Again, it was only sold in round, so after it was in, I chipped away the corners to make it square. Tips: Don't go too deep. Have the hinge handy so you can stick it in place to determine if you need to make it deeper or not. Also, invest in some actual wood chisels for this part. I bought a pack of three for \$9 at Home Depot and they made the job pretty easy. Also remember that hinges come in different sizes, so make sure if you are using a butt marker or even a template that you are using the correct size. Ok, so here is a Wilker Don't and I'm pretty ashamed of myself for this one. When the door was in the shop and after I used the router and template to mortise in the middle, I took a measurement from the top hinge down to the top of the one I just created so that I could determine where to place it on the door jam inside the house. Not too complicated right? Well, with the door laying flat I forgot to take ordination of it and in fact took a measurement from what would become the bottom hinge to the middle. This means that when I went to put the door back in place, the top and bottom hinges lined up, but not the middle. I wasn't about to chisel out another mortise in the jam, so I ended up using the template to relocate the mortise on the door. Eh, silly mistake. 6) Now that all the mortising was done, I started to put my tough hinges on the door when I remembered (with one look) that they were hideous. So I set them up on a scrap piece of wood and gave them a quick paint job. After they were dry, I screwed them into the door. 7) Next, with no puny hinges in sight, was to hang the door back on the jam and load up my shelving unit. Total Time: 1.5 Total Cost: \$30 As many of you know, we've been renovating our townhouse which is a rental property we are getting ready to sell. Most of the work has been done by contractors, but I took on a few projects myself, including the one I'm sharing with you today. I'm going to show you how to cut out notches for door hinges the easy way! I had no idea how to go about doing this, but my contractor was going to charge me \$1400 to install and paint 10 doors, so I decided I could definitely figure out how to do it myself and save some money. So today I'm showing you what I learned! Hopefully some of you will find it helpful in case you ever have to swap out or install doors in your home.What You'll Need:(Affiliate links included. As an Amazon Associate I earn from qualifying purchases.)Since I was replacing the old dated doors with new hollow core 6 panel doors, I needed to create notches for the new hinges. I bought this RYOBI door hinge template at Home Depot and this made it super simple. I'll show you how it works.Now before I actually used this on the actual doors, I practiced with it on a piece of scrap wood which I highly recommend doing just so you can get a feel for how it works.First of all, you adjust the template based on the size of your hinges. I'm installing 3 1/2 inch hinges so I adjusted it accordingly.You also adjust it based upon whether your hinges have curved corners or not. Mine have a 5/8" radius on the corners. You can remove the curved pieces from the template if you're using square cornered hinges. I adjusted it to the proper length and made sure both curved pieces were installed since both corners on one side of my hinges are curved.Next, you adjust your router depth using this guide on the side of the template.The template comes with a special router bit for you to use which has a little guard on it so that you don't cut into the sides of the template.Then you place your router bit in the appropriate slot. I used the one on the left since my hinges are thin (the other one is for thicker hinges) and then adjusted the depth of my router accordingly.By the way I absolutely love this little battery powered compact router from Ridgid.After I practiced on my scrap wood, it was time to cut notches in the actual doors. I used our old doors to mark and measure the spots for the new hinges. If you don't have existing doors to use as a guide, then measure from the top of the door frame and subtract 1/8" (per the template instructions).Once you've set your depth, you attach your template onto the edge of your door making sure the curved corners are facing the correct side, and tighten it with the little knob on the side.Then, you just carve away inside the template using your router. Be sure to turn your router off before removing it from the template as I did accidentally bump the side of it a couple times when I tried to pull it out before it had turned all the way off. (Oops!)This template made the job so ridiculously easy. After you've routed for your hinges, you just position the hinge in place and then can pre-drill holes for your screws. I ordered new hinges which haven't arrived yet so I'm using an old one for demonstration purposes here.This isn't sponsored, by the way, I just found this template super helpful and thought you might too.I'll be sharing the full townhouse renovation very soon! It's so close to being done and then it will be put on the market. You can also check out my YouTube video tutorial for this DIY project here:Thanks for visiting!-Erin
