There is nothing more unpleasant than changing something back and forth between a computer and a phone, trying to work and write someone. It is difficult to maintain a good workflow and the battery suffers depending on what another phone needs. Android users had no choice but to use other messaging programs just to talk to friends from their desktop computers. However, if you do not know, you can use it to write Android messages in desktop browser. Fi Network. (It still doesn't have to be the same network. There is a special program that can be downloaded. It is easy to use it and just like in Apple IMSSAG -Ithe phone using your phone using Stoptop.mond, Make sure your phone correspondence program is updated. Google.com messages Web/ will appear QR Code Open the message on the phone Click on the Settings section (three points on the right right at the top right of the corner). Sprinkle messages for web 5. Keep the phone a few centimeters from the QR code you see on the computer screen and make sure it is Filled. Show search engine on phone screen. This QR code, your people are automatically filled on the screen and are ready to start writing messages. You will not read this computer before scanning with QR code. If you do not do so, you will need to match your device each time. You only want to save contacts if you only have a personal notebook to or desktop computer to protect your privacy. If you write text on a commonly used computer, be sure to sign in.There is nothing more frustrating than moving from computer to phone, trying to do work and send messages to someone. It is difficult to maintain a good flow of work, and the battery will affect what the phone does. For years, Android phone users had no choice but to use other applications for sending messages when they wanted to talk to friends from a desktop computer. But if you don't know, you can use Android in a stationary browser for writing. Network fi. (But it can't be the same network.) If the phone is turned off, the computer does not have Wi-Fi or you use air mode, you will not be able to use the message. Web. Messages are a predefined text message for pixel phones, but on Android, not Google, there is also a dedicated application that everyone can download from the Google Play store instead of a predefined text application on pixel phones. It is easy to use and the operator has no penalty for moving from each other to the other. Like Apple IMessage, messages for the network allow you to continue talking from the computer screen. Remember that from time to time you may have to pay back the phone in the office. Before starting, make sure that the phone message is updated. Let's do it! You will no longer have to switch from one device to another. Jason Pepper/Cnet How to set messages for the network on your computer 1. On the computer, open a new browser or window (we recommend the window) and go to the news.google.com/web/. The code will appear QR. Open the message on the phone. In the messages, touch the settings (three points in the upper right corner). Touch "News to the network". 5. Hold the phone a few centimeters from the QR code, which can be seen on the computer screen and make sure it fills the view of the phone screen. After scanning the QR code, your contacts will automatically appear on the screen and will be ready to send messages. This is a QR code for scanning with the phone. Screenshot Gordon Gottsegen/Cnet some important suggestions, remember that the computer that you send a message does not save your information, unless you go to this computer with the QR code before scanning. Otherwise you will want to save your contacts only if it is a personal laptop or desktop computer. If you write on a public computer, make sure you are disconnected.If you forget, you can get a sign notification letting you know you're always connected. You can also add a sign to the site to make it easier to send text messages whenever you need them. Now playing: Watch this: Send an SMS from your computer or Mac using Android messages more than text when you set up web messaging on your computer. You can do a lot. First, enter the name of a friend or group and send SMS. You can also add a phone number. Just like you do on your phone, you'll receive SMS in web messages, and when a new message arrives, you'll see a notification banner (and a thing) in the top-right corner of the screen. Web messages support many support. After what you can see and do with Android Messages on your phone. You can send dozens of emotions, GIFs, photos, videos and stickers to your friends. You can also enable Dark Mode. You can't share your location, send or request funds with Google Pay, use voice textures, share contacts, or reach a file. You also won't see the prediction text suggestions. But it's worth it if you save your office while you work. Now playing: Check out this: Google Assistant intelligently transforms your Android Google Messages on the web. It's easier for you to chat with your family and friends on your computer without downloading any additional application. The web application is easy to use and has a low barrier at the entrance. If you've come across Google news on the web and are wondering what it is, what it's for, and how it's used, you're in the right place. Here's a complete Google News guide for the web. What is Google news for the web? With Google Web Messages, Android users can chat with friends, family, colleagues, etc. right on your computer in a web browser. This is a web application that allows you to discuss. This provides a complete view of all your messages in Google Messages in the mobile app. In simple terms, Google messages are in the browser compared to the version of your usual messaging application, but with certain limitations. With Google Message you can connect your mobile messaging application that allows you to send SMS by phone from your desktop or mobile computer. As in a classic application, the operator's costs are applied by sending a message through Google messages on the web. The only difference is that you use a connection between your computer and your phone. However, if you and the recipient have an active RCS, you can ignore the cost since you're just using the internet connection.And get messages. Google Messages for Website is supported by many Android devices, but not all. If you have Android 5.0 or higher on your phone, you can use Google messages for the internet. Here's a guide on how to check your Android version if you're not sure what you're doing. While the Google Messages app is not available on iOS devices, you can use the iOS application with Google Messages for the Internet. Google Messages for the Internet is easy to use. After installing the latest version of the application, run the following steps to start sending messages from your computer via Google Messages for a website: Call the Google Messages website on your computer in a web browser. Open Messages on your Android phone. Click on a tripartite menu in the upper right corner and select a connection with the device. Click the QR Code Scanner button and focus on the QR code displayed in Google for Internet messages. This makes your message "Messages", immediately related to Google messages for the Internet. Multiple computers can be connected at the same time, but you can only one. If you want them to connect automatically next time, click "Save the switch next to this computer." You can start 2 images after a successful connection by sending messages via Google messages for the Internet. If you no longer want to send messages on the Internet, you can collect a link to the message application. You can do this on your computer through your Android phone or directly through Google messages for the Internet. First we'll show you how to do Android. Google Links for Android Open the message application and click on the three-dot menu in the upper right corner. Choose your device connection. Select a specific device on the next page, the connection of which you want to cancel. Click the X button next to the device you want to split and confirm the request by selecting a split. Alternatively, share all devices by choosing all devices. Linking 2 images of Google messages on a PC If you don't take your phone and want to take Google messages for the internet, go to the Google Messages website. Choose three TACAC menus and click Hip > Link. As in most programs, Google Messages must meet certain Internet requirements in order to use the application. Firstly, as mentioned above, at least Android 5.0 should be built on your Android phone. The second prerequisite for using Google messages for the Internet is the latest version of the mobile message application. So first update your Google posts. Thirdly, you should have WLAN or data connection. From Google messages for the InternetThe mobile application computer is a need to connect to the internet through internet connection. Therefore, if this connection is cut, you can no longer chat with Google messages for the web. This is the greatest restriction of the application. Another limitation of the use of Google messages in the browser is that you can have effective talks on only one tab at a time. If you have connected your Google messages on different devices for the web, you can only use it to chat at the same time. The rest will be active. Only a few web browsers, including Chrome, Mozilla Firefox, Safari and Microsoft Edge, also support Google websites. Google's requests for the site are practical and allow you to communicate with your friends and family without phone calls. Despite the limits of the application, you cannot ignore the additional comfort it brings to our lives. It is easy to use and you will be right with the above instructions. Above.
