Youth cat for other uses, see Kitten (disambiguação) and kitty (disamb to explore the world out of their nest. After three more than four weeks, they begin to eat solid foods and to cultivate baby's teeth. The domestic kittens are highly social animals and usually enjoy the human company. Etimology and Developing a Kitten Opening the eyes for the first time a pair of kittens Brothers of the same litter at 11 weeks The word "kitten" derives from the English word MA © Kitan, which in turn came from the old Chitan French or christen [1] Big juvenile cats are called "puppies" instead of kittens; Any of the terms (but generally more commonly "kitten") can be used for smaller wild felvers, such as jaguatiricas, caracal and lynx [2] a feline litter usually consists of two to five kittens [3], but are known nails with one more than ten [4] the kittens are born normally after a gestation that lasts between 64 and 67 days, with a 66-day half-day duration [3] They are born, the kittens emerge in a bag called the anio, which is bitten and eaten by the cat cat [5] during the first few weeks, kittens can not urinate or defecate without being stimulated by their mother [6] It can also not regulate the temperature of your body during the first three weeks, so the kittens born at temperatures below 27 °C (81°F) may die of hypothermia if your mother It does not keep them warm [7] Breast milk is very important for kittens nutrition and for proper growth. This milk transfers antibodies to the kittens, which helps protect them against infectious diseases [8] as above, they cannot urinate, so they have a very high need for fluids [9] Kittens open their eyes about ten weeks after birth. [10] Kittens develop very quickly from about two weeks of age © the last week. Their coordination and forts improve, and they play with their brooding companions and start exploring the world outside the nest or pit. They learn to wash up and others, as well as to play dog and chase games, showing their innate ability as predators. These innate abilities are developed by the hand of kittens or other adult cats, which bring live prey to the nest. Later, the hand demonstrates of dog for the kittens to imitate. [11] As they reach three to four weeks of age, kittens are gradually weaned and start eating sorlido foods, with usually full weaning for six to eight weeks. [12] Kittens usually start losing their baby teeth about three months old, and they have a full set of adult teeth for nine months of age, while others continue to care for them until © as they approach sexual maturity[14] The sex of kittens is © usually easy to determine at birth. For six to eight weeks they are more difficult to have sex because of the growth of skins in the genital region. The opening of the until veeks they are more difficult to have sex because of the growth of skins in the genital region. The opening of the until veeks they are more difficult to have sex because of the growth of skins in the genital region. The opening of the until veeks they are more difficult to have sex because of the growth of skins in the genital region. distance between the amber and the opening of the urethra, which is © higher in males than in females.[15] Kittens are highly social animals and spend most of their watch hours interacting with available animals and playing on their own. Play with other peaks of In the third or fourth months after the birth, with more lonely hunt and persecution play peak later, in about five months. [16] Kittens are vulnerable because they like dark places to hide, sometimes with fatal results if not watched carefully. Cats have the habit of seeking reuse under or inside cars or on top of car tires during stormy or cold weather. This usually leads to bones, burns, heat stroke, damaged internal organs or death [17] Home © kittens are commonly sent to new homes at six to eight weeks of age, but it has been suggested that being with their hands and woods from six to twelve weeks is © for the social and behavioral development of a kitten under twelve weeks old. In many jurisdictions, it is © to give kittens under eight weeks of age. [18] Kittens usually reach sexual maturity around seven months of age. A cat reaches full "adulthood" around one year old. [19] Home©stic kittens usually reach sexual maturity around seven months of age. The usual combined vaccine protects against feline viral rhinotracage (FVR), feline Calicivirus (C) and feline panleukopenia (p). This inoculation against rabies can be administered at sixteen weeks. Kittens are usually sterilized or neutered at seven months of age, but kittens can be neutered as young as seven weeks (if it is large), especially in animal shelters. [20] This early neutralness does not seem to have long eterm health risks for cats, and can expecially in animal shelters. [21] Kittens are commonly received desilage treatments for round larvae for about four weeks. [22] Play a kitten drinking milk from his mother. inclusion of carbohydrates. Kittens are categorized into a growing life phase and have high energy and protection requirements to help in development in order to produce a healthy adult[24] In Amman © rich in the North, the diets certified by the Association of American Feed Control Officials (AAFCO) are accepted a s adequate nutrition, and cat diets should therefore be approved by the AAFCO to ensure complete supplementation[25] The key components of the diet are a high fat content to meet the caloric needs of growth, high protein to meet the needs of muscle growth, a s well as the supplementation of certain nutrients such as the docosahexane acid to benefit the development of the immune system of the mucous immune system, which is within the gastrointestinal tract. The immune system of mucous membranes © largely responsible for coordinating adequate immune responses, tolerating antigen © innocuous and attacking pathogens © In order to optimize the health of the kittens and increase the survival ratios, a © important to optimize the connection between the lymphoid tissue associated with the gut and the gastrointestinal tract microbiota. Durable health and longevity can be achieved in part through © adequate nutrition[28] and the establishment of a healthy intestine from mother's milk[30] Milk in the first days after birth © called colostrum, and CONTENT © These include immunoglobulin A and immunoglobulin G which pass through the intestinal barrier of the rec © m-born[29] Immunoglobulins and growth factors found in the colostrum begin to establish and strengthen the weak immune system of offspring[31] Kittens are of chewing silent foods about 5 µm 6 weeks after birth, and it is recommended that 30% of your diet be constituted by saplid food at this time [32] The kitten remains in the milk of mother to about about Weeks of age when the weaning is complete and a diet a healthy diet of food is © the primary source of food. [23] Fatty nutrition starvation until © about a year old, the kitten is going through a growing phase in which energy requirements © Attic are s o © 2.5 times higher than maintenance. [33] Pet feeders often suggest that a commercial cat food specifically designed for kittens should be offered in the event of four weeks of age. [28] Fat has a higher caloric value than carbohydrates and proteins, providing 9 kcal/g. [34] The growing kitty requires arachidonic and linoleic acid that can be supplied in fatty acids omega-3.[23] The docosahexanoic acid (DHA) © another vital nutrient that can be provided through © the fatty acid of omega 3. The addition of DHA to diet benefits cognition, dog © The protective cats are natural carriers and require high amounts of protein to provide essential amino acids to allow tissue and muscle growth.[30] It is recommended that kittens consume a diet containing approximately thirty% proteins on a matter basis. © dry laugh for proper growth.[35] taurine is © an essential amino acid found only in animal tissues and cannot be produced in sufficient quantities by the cat.[36] Since © an indispensible amino, must be supplied exogenomically through © Dietary Josep 160mg/kg bodyweight/day.[37] Taurine-free kitchens can experience poor growth[36] Feline carbohydrates. The home cat's fan © cystic adapted to the lack of carbohydrates in diet a, using amino acids to produce glucose for The brain and other fabrics. Studies have demonstrated that the digestion of carbohydrates in puppies is much less effective than that of a mature feline with a gastrointestinal tract developed [40]. Highly digestable carbohydrates may Found in commercial kitten food as an additional energy source as well as a fiber source to stimulate immature fabric. Solid fiber, as beet cellulose is a common ingredient used as a fibrous feces hardener and proved to strengthen intestinal muscles and thicken the intestinal muscles are fibrous feces hardener and proved to strengthen intestinal muscles and thicken the intestinal muscles are fibrous feces hardener and proved to strengthen intestinal muscles and thicken the intestinal muscles are fibrous feces hardener and proved to strengthen intestinal muscles are fibrous feces hardener and proved to strengthen intestinal muscles are fibrous feces hardener and proved to strengthen intestinal muscles are fibrous feces hardener and proved to strengthen intestinal muscles are fibrous feces hardener and proved to strengthen intestinal muscles are fibrous feces hardener and proved to strengthen intestinal muscles are fibrous feces hardener and proved to strengthen intestinal muscles are fibrous feces hardener and proved to strengthen intestinal muscles are fibrous feces hardener and proved to strengthen intestinal muscles are fibrous feces hardener and proved to strengthen intestinal muscles are fibrous feces hardener and proved to strengthen intestinal muscles are fibrous feces hardener and proved to strengthen intestinal muscles are fibrous feces hardener and proved to strengthen interestinal muscles are fibrous feces hardener and proved to strengthen interestinal muscles are fibrous feces hardener and proved to strengthen interestinal muscles are fibrous feces hardener and proved to strengthen interestinal muscles are fibrous feces hardener and proved to strengthen interestinal muscles are fibrous feces hardener and proved to strengthen interestinal muscles are fibrous feces hardener and proved to strengthen interestinal muscles are fibrous feces hardener and proved to strengthen interestinal muscles are fibrous feces hardener and proved to strengthen interestinal muscles are fibrous feces hardener and proved to strengthen interestinal muscles are fibrous fece carbohydrates in the diet resulted in the tender adaptation to produce glucose of protein to provide amino acids promptly active in cats. Thus, cats need a constantly active in the amount of protein to provide amino acids promptly available for daily maintenance and to build new bodily components because they are growing constantly. [24] There are many necessary amino acids for kittens. Histidine is necessary in more than 30% in kitten diets, since consumption of histidine free diets causes weight loss. [25] The tryptophan is required by 0.15%, seeing how performance maximizes on that level. [25] Kittens also need the following amino acids supplemented in their diet: arginine to avoid an excess of ammonia in the blood, known as hyperamoney, isoleucine, leucine, valine, leucine, valine, leucine, threonine and taurine to prevent degeneration of central retina. [25] Gord-solitive vitamins Vitamin A is needed on kitten diets because cats can not convert carotenes to retinol in the intestinal mucosa, because they do not have the necessary enzyme; This vitamin should be complemented in the diet. [24] [42] Vitamin E is another vitamin necessarial in kitten diets; The deficiency takes the staatitis, causing the fat of the becomes steady and yellow-orange in color, which is painful and takes death. [42] In addition, vitamin D is an essential vitamin because because can't convert it from precursors to the skin. [24] Vitamin solizable cats in water can synthesize niacin, but their description exceeds the rate that can be synthesized and therefore have a higher need for it, which can be fulfilled through © is from an animal-based diet. [24] Vitamin B12 is © a recommended vitamin of AAFCO which is © essential in carbohydrate and protein metabolism and mantle © A healthy nervous system, healthy mucous membranes, healt Biotin © Another vitamin recommended by the AAFCO to support thyroid and adrenal glands and reproductive and nervous systems. [24] Kittens too © m require riboflavin (vitamin B2) for cardholder, pantothenic acid (vitamin B2) and folacin. [42] The metabolism AIDS As kitten diets are very high in calories, the ingredients must be implemented to ensure adequate digestion and use of these calories. Choline chloride © an ingredient that keeps © Their metabolism is fat. [42] Biotin and niacin too © m m © Needed for the digestion of fats and carbohydrates. [42] These are the main metabolism aids incorporated into kitty diets to ensure that the use of nutrients is maximised. Play Kitten by day who plays in a store growth and development of the kitty body; There are many ingredients that kittens do not require, but are included in the to encourage healthiness and development. These ingredients include: dry egg as source of high quality protein and fatty acids and © important for healthy skin. [42] Antioxidants from immunity boosters help support the development of a healthy immune system through the inhibition of oxidation of other of a healthy immune system through the inhibition of oxidation of other of a healthy immune system through the inhibition of oxidation of other of a healthy immune system through the inhibition of oxidation oxi A young black kitten, showing signs malnourished kittens require a high calorie diet that contains more protection than the diet of adult cats. [43] Young kittens require cat milk every two to four hours, and need physical stimulation to defecate and urinate. [6] The replacement of cat milk is © manufactured to feed on young kittens because cow's milk does not provide all the necessary nutrients. [44] Kittens raised by humans tend to be very affectionate with humans as adults and are sometimes more dependent on them than kittens raised by their hands, but also very affectionate with humans as adults and are sometimes more dependent on them than kittens raised by their hands, but also very affectionate with humans as adults and are sometimes more dependent on them than kittens raised by their hands, but also very affectionate with humans as adults and are sometimes more dependent on them than kittens raised by humans tend to be very affectionate with humans as adults and are sometimes more dependent on them than kittens raised by their hands, but also very affectionate with humans as adults and are sometimes more dependent on them than kittens raised by humans tend to be very affectionate with humans as adults and are sometimes more dependent on them than kittens raised by humans tend to be very affection and are sometimes more dependent on the provided as a sometime with humans as adults and are sometimes more dependent on the provided as a sometime with humans as adults and are sometimes more dependent on the provided as a sometime with humans as adults and are sometimes more dependent on the provided as a sometime with humans as a sometime with a sometime with humans as a sometime with a some cardinal conditions. The compromised immune system of rfão kittens (since the lack of antibodies found naturally in breast milk) can make them especially susceptible to infections, making antimicrobials a necessity.
